PALETTE PICKER

BY: SPENCER FURGERSON

Palette Picker fits into the **“Tool” category** of this project.

I love color palettes, and this project is very much inspired by the Coolers website and plugin. Coolers is extremely clean and has infinite palettes to discover and lots of nice tools. While this site is not near as advanced, I thought it would be possible for me to design on my own.

Palette Picker will feature 256 colors which can be randomly generated into a palette of four colors. The colors can be locked and filtered by shade and hue, and hex codes can be copied right off the screen so you can use the colors for whatever you like. A sidebar features a randomly generated set of palette ideas which I have generated using the color set. You can click on them to make them appear on the palette panel and use them for your own design purposes. Finally, I want to make the background update with a gradient of the colors on the palette panel every time they are changed. Wish me luck!
